

Machine Learning for High Frequency Bitcoin Price Prediction

Chris Bynum

“High Frequency”

Co-location on a sophisticated exchange

- **microseconds**

HTTP to a bitcoin exchange

- **milliseconds / seconds**

Dataset

Recorded live

1. Snapshot of open orders every second
 - 4 weeks: **2.4 million** observations
 - Each observation: matrix of buy / sell orders
2. Record of all executed transactions

Order Book

Bids			Asks		
Price	Amount	Cumulative	Cumulative	Amount	Price
231.24	6.87	6.87	6.93	6.93	231.32

Objective

- Engineer features from orders and trades
- Predict midpoint price 30 seconds in the future

Features

23 total, including:

- Market width
- Measures of order book volume imbalance
- A measure of whether buyers or sellers were recently more aggressive
- Other features on trade volumes and prices

The Model

Decision Tree

- Find interactions

Random Forest for experimentation

- Can be parallelized
- Not highly sensitive to parameters

Gradient Boosting for final model

Model Validation

--	--	--	--	--	--	--

Results

	R-Squared
Linear Regression	0.0332
Random Forest	0.0744
Gradient Boosting	0.0846

Theoretical Trading Strategy

Theoretical Trading Strategy

Next Steps

- Keep collecting data
- Incorporate findings into a trading system

bitpredict.io
